Week 6 Reflection

For Week 7, I connected my front-end to a real back-end using Node.js, Express, and MongoDB, running on localhost:3000 earlier the form wasn't saving because I was opening the page through Live Server instead of my actual Express server, but once I ran it with node server.js, the "Add User" form started saving real users to MongoDB, with them appearing instantly in the "User List" along with working Delete buttons, and the biggest lesson this week was debugging, learning to read console errors and terminal logs together to figure out what was actually broken instead of guessing, which made this the first week my project felt like a real full-stack app with the form, server, and database all working together.
